PREFACE

This is the final report of work performed under contract number OSU82-00430 entitled "CESAR radiopositioning evaluation", funded by the Earth Physics Branch of the Department of Energy, Mines and Resources. The Scientific Authority for this contract was Dr. J.R. Weber.

Part of the work contained herein was funded by an operating grant entitled "Arctic navigation/satellite positioning" from the Natural Sciences and Engineering Research Council of Canada.

The many plots for this report were painstakingly generated by Corey Dean Wells.

CHAPTER 1

INTRODUCTION

The Canadian Expedition to Study the Alpha Ridge (CESAR), provided a unique opportunity to collect and evaluate radiopositioning data at high latitudes. Results of this evaluation are of potential importance both for future scientific expeditions to high latitudes, and for planning effective navigation aids for marine transportation through the Canadian arctic.

During CESAR, radiopositioning observations were collected between 30 March (day 89) and 23 May (day 143) 1983, in the vicinity of latitude 86°N , 110°W .

1.1 Observation Types

These radiopositioning observations were of three types:

- (1) Transit satellite Doppler observations, high frequency signals transmitted by Transit satellites and received on CESAR using Canadian Marconi CMA-761 receivers.
- (2) Decca, low frequency signals from a chain of three Decca transmitters established along the coast of Ellesmere Island by the Canadian Hydrographic Service and the Polar Continental Shelf Project.
- (3) Omega/VLF, very low frequency signals from the worldwide network of eight Omega transmitters, plus VLF communications transmitters, received on CESAR using a Canadian Marconi CMA-771 receiver.

The Transit observations provided the main source of reference positions (and were available) for the entire CESAR field program. The Decca observations were available and automatically recorded only for about

six days (days 115-122). Omega positions were manually logged every 12 hours during the field program, and every 10 minutes for one 13 hour period (days 123-124).

In addition, complete Omega observations were recorded during five, 24-hour periods (days 93-94, 103-104, 113-115, 123-124, and 134-135). These five Omega data sets are being analysed by Canadian Marconi Company and are not included in this report.

The Transit data was processed by Dr. J. Popelar, of the Earth Physics Branch, to provide smoothed positions and velocities of the CESAR camp at three-hour intervals. In this report, his results are used as a reference to evaluate the Decca and Omega data.

A magnetic tape containing all the data and software used in these evaluations is available. The contents of this tape are described in Appendix A.

1.2 Processing Methods

The University of New Brunswick, Surveying Engineering Department's HP-1000F computer was used to process the data. The Autoplot feature of the HP-2648A terminal was used to generate the plots, and a hardcopy of them was obtained via the HP-2671G plotter.

The Transit and Decca data were transferred from cassette and magtape to disk files. The Omega data was manually entered into disk files using the EDIT/1000 program.

Program CESAR was written to reformat all data into a standard form for plotting. Polar stereographic coordinates were computed for all data. For Decca and Omega data, the difference between the Decca and Transit, and the Omega and Transit positions, respectively, were computed and expressed

as both errors in northing and easting, and as magnitude and direction of the position differences. The reference Transit positions were obtained by linearly interpolating between the input 3-hour values. All coordinates and errors are in metres.

Histograms of these results were computed by program HISTO, which reads the CESAR output files as input and produces its own output files for plotting.

Prior to conversion to polar stereographic coordinates, the Decca position fixes were first recomputed using the WGS72 datum. No datum shift was applied to the Omega data. To maintain consistency with the software used during the CESAR field program, a slightly different ellipsoid was used in the conversion to polar stereographic coordinates. The relevant datum parameters are:

- (a) WGS72: $a = 6378145$; $1/f = 298.25$.
 - (b) NAD27: $a = 6378206.4$; $b = 6356588.8$; $dx = -8$ m; $dy = 169$ m; $dz = 176$ m.
 - (c) Conversion to polar stereographic: $a = 6378144$; $1/f = 298.23$.
- (NOTE: NAD27 was not actually used during the processing.)

1.3 Camp Motion

Position velocities and rotation of the CESAR camp, as represented by the Transit data, are shown in Figures 1-1 to 1-7.

The rotation is obtained from the relative positions of two Transit antennas, separated by about 30 metres. Due to the short length of this baseline, small relative position errors result in large inferred camp rotations. However, the estimated baseline length is then also in error, as shown in Figure 1-6.

All Transit results depend on how often the Transit passes occur. The

number of passes per three-hour intervals are shown in Figure 1-7. Note the correlation between low number of passes and high standard deviations in Figures 1-3 and 1-4.

CHAPTER 2

DECCA

2.1 Geometry

The Yelverton Bay Decca chain was established by the Canadian Hydrographic Service with three stations on Ellesmere Island, approximately 500 km southeast of the CESAR camp. Figure 2-1 shows the relation between the camp and these stations, in the Polar Stereographic coordinate system.

This Decca chain began operating on day 111. Changes were made to the chain calibration on day 112. Decca data began to be recorded at CESAR on day 115, and this continued until the chain went off the air on day 122.

During this time, the camp moved very little: less than 2 km during the first five days (when Decca was recorded at 30-minute intervals), and about 1.5 km during the last day (when Decca was recorded at 1-minute intervals). See Figures 2-2 to 2-4.

The Decca Red lanewidth at CESAR is about 2500 m, and the Decca Green lanewidth is about 4600 metres. The intersection angle between the Red and Green patterns is about 16° (see Figure 2-5). Small errors in the Decca readings will therefore result in large displacements in the position fix, according to

$$d = \operatorname{cosec} A \sqrt{DR^2 + DG^2 + 2 DR DG \cos A} \quad ,$$

where DR = Decca Red pattern error in metres (0.01 lanes = 25 m)

DG = Decca Green pattern error in metres (0.01 lanes = 46 m)

A = pattern intersection angle (16°)

d = displacement of the position fix in metres.

For example, if both Decca Red and Green readings were 0.01 lanes too high, the position fix would be displaced about 250 metres northeast on the Polar Stereographic grid (see Figure 2-6).

2.2 Datum

Two sets of coordinates for the Yelverton Bay Decca transmitters were established by Marinav Canada for PCSP. The coordinates of the transmitters were first obtained by Transit single point positioning. These coordinates were expressed in the WGS72 coordinate system and are shown in Table 2-1.

Using the datum translation components for Alert Point, as listed in Surveying Offshore Canada Lands [EMR, 1982], Marinav transformed these WGS72 coordinates into NAD27 coordinates, shown in Table 2-2.

It appears that the program used during the CESAR field program used the WGS72 station coordinates, but computed the Decca fixes using the NAD27 (Clark 1866) ellipsoid.

In any case, the Decca observations were also recorded, and were used here to recompute the fixes using both WGS72 coordinates and WGS72 ellipsoid.

2.3 Calibration

The Decca chain calibration was initially set from observations at a single known point, the Alert Point Transit station.

On 29 April (day 119) and 1 May (day 121), Decca readings were compared to Miniranger positions. Corrections of the order of a few hundredths of a lane were determined [MacDougall, 1983]. See Table 2-3.

As part of the reprocessing of the Decca observations at CESAR, theoretical Decca readings were computed, based on the CESAR camp Transit coordinates, at the time of each observed Decca reading. These theoretical, or "true", readings were compared with the observed values. The results are shown in Figures 2-7 and 2-8. For much of the observation

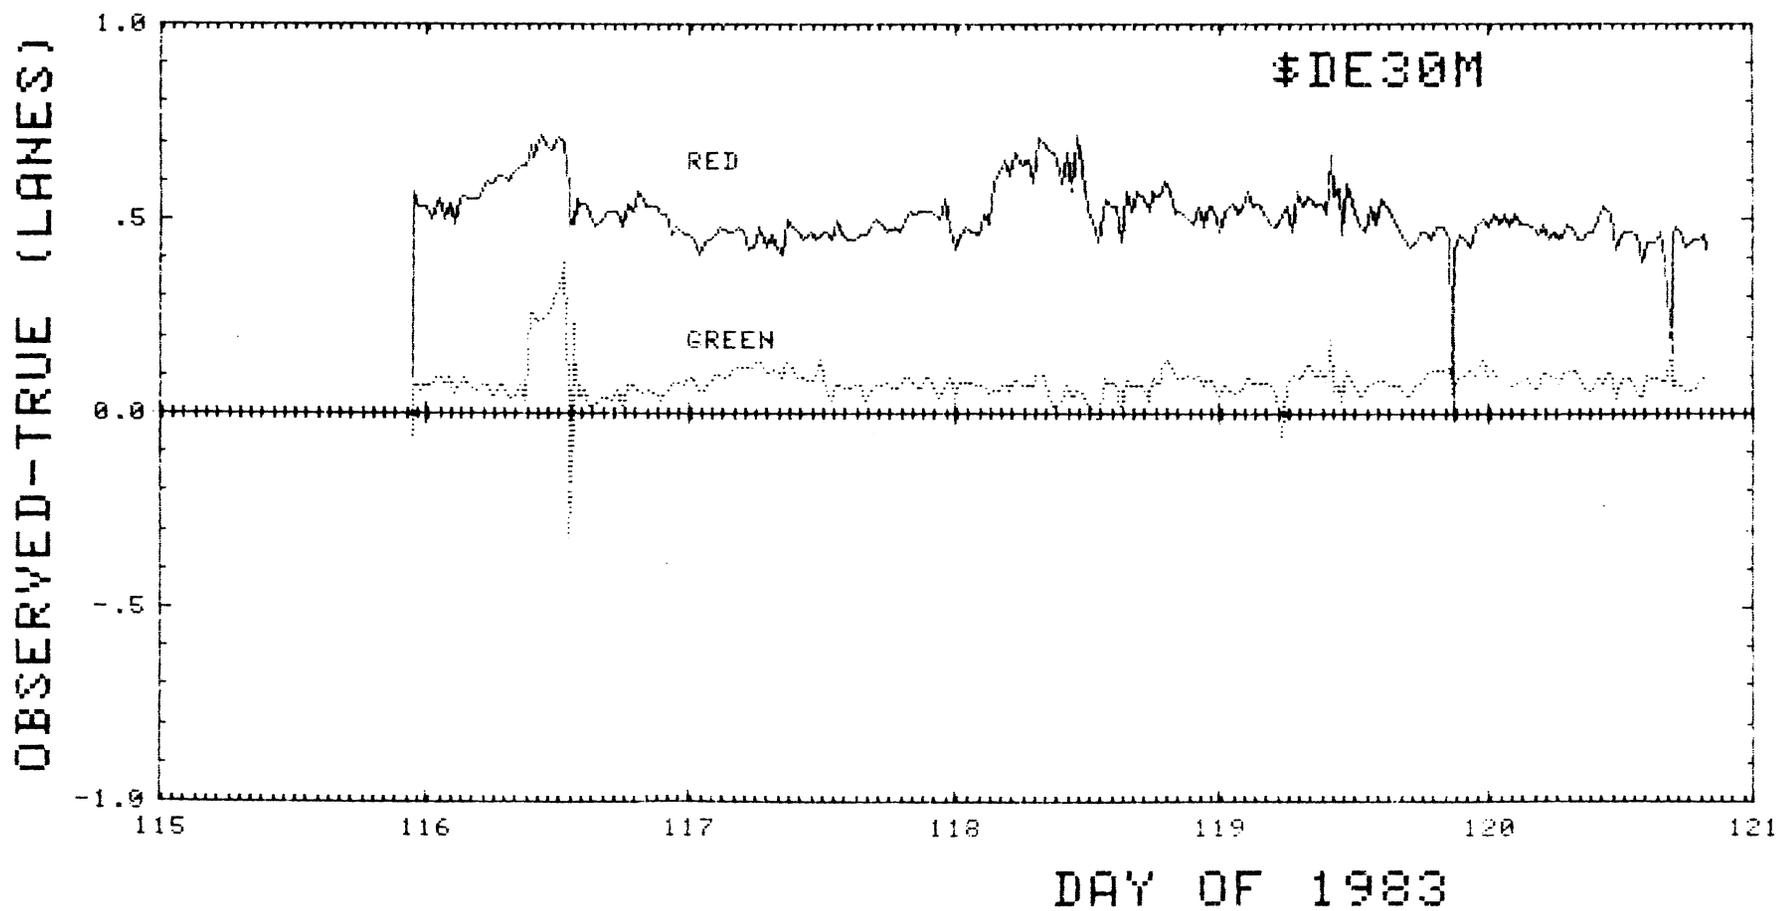

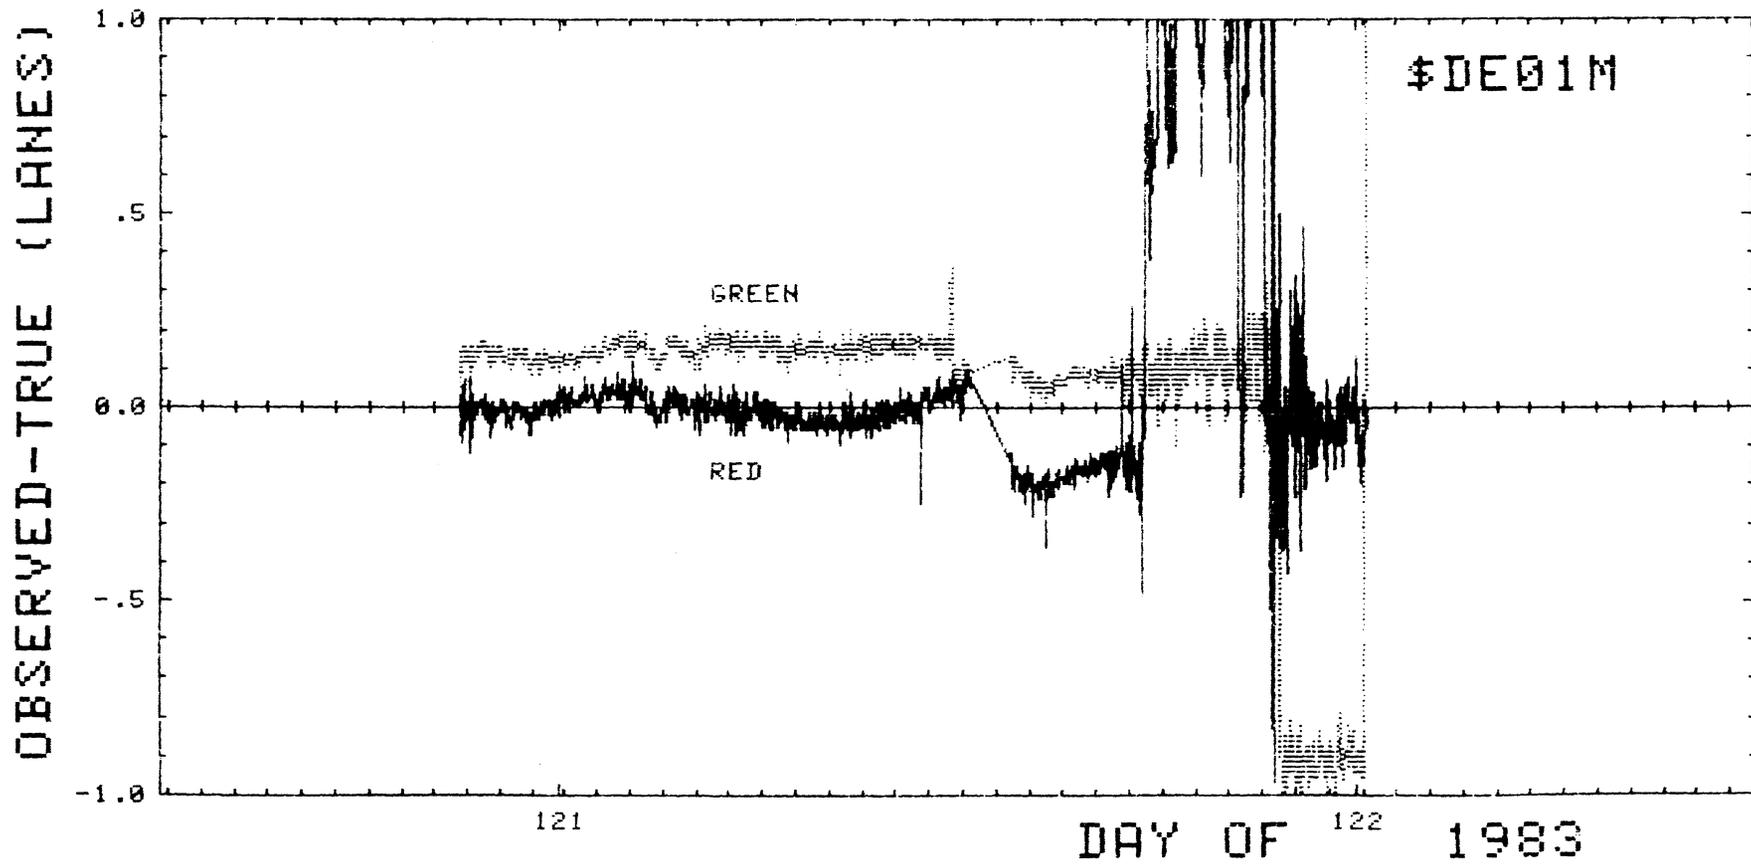

Figure 2-8

Observed-True Decca Readings, 1-Minute Data (before calibration).

period, reasonably stable biases can be inferred from these results, as given in Table 2-4. Figures 2-9 to 2-13 show histograms of these residual readings.

These results indicate Decca Red was reading one lane high from 121 1740 to 121 2150, and Decca Green was reading one lane low from 121 2150 to 122 0020. Note that day 121 was when Miniranger calibrations were being performed.

In addition, it would appear that Decca Red was reading a half lane high for most of the period of Decca operation, from 115 2250 to 120 1950. Other biases of up to a few tenths of a lane occurred.

The biases in Table 2-4 were subtracted from the observed readings during a second processing run. The resulting readings, compared to the theoretical readings derived from Transit, are shown in Figures 2-14 and 2-15, and their histograms in Figures 2-16 and 2-17.

The means and standard deviations of the observed minus theoretical Decca readings, before and after subtracting the biases of Table 2-4, are shown in Table 2-5.

2.4 Results

Time series plots and histograms of the offset between Decca and Transit positions, expressed both in Polar Stereographic coordinate differences and in magnitude and (grid) direction, are shown in Figures 2-18 to 2-33, both before and after applying the calibration biases.

Means and standard deviations of these results are given in Table 2-6.

Complete listings of the calibrated Decca results are contained in Appendix D.

CHAPTER 3

OMEGA

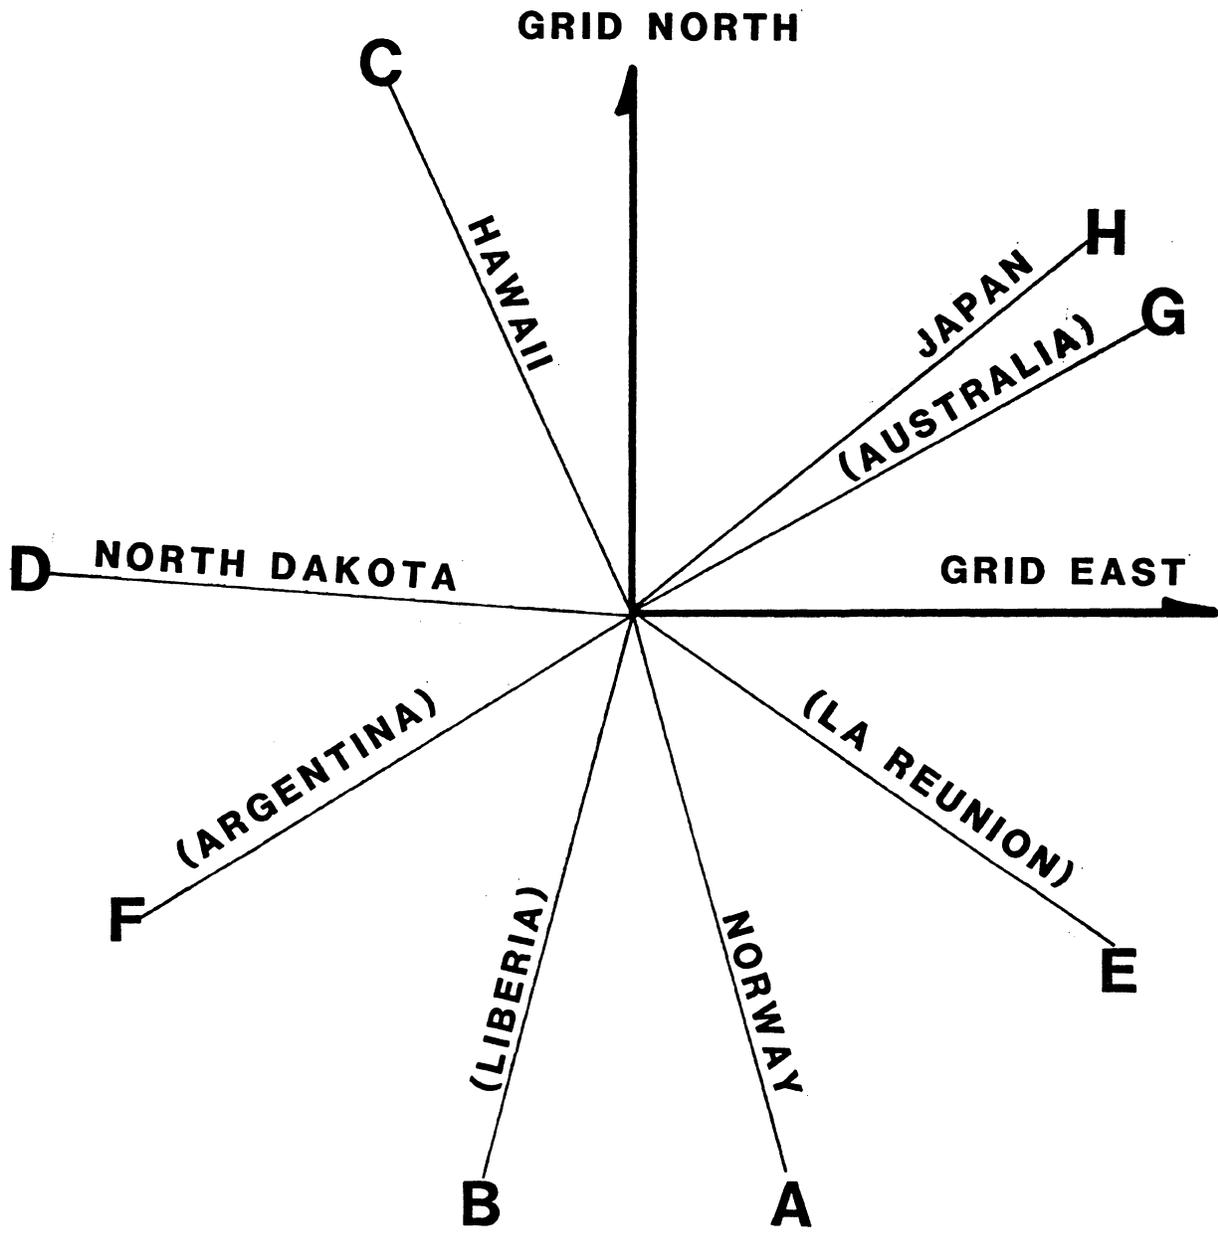

3.1 Geometry

Figure 3-1 shows the geometry of the CESAR camp, relative to all eight Omega stations, in the Polar Stereographic grid system. No information was available on which stations were actually used by the CMA 771 receiver (and which VLF stations were used as well). It is unlikely that the furthest stations (bracketted in the figure) were used, however.

3.2 Results

Time series plots and histograms of the offset between Omega and Transit positions, expressed both in Polar Stereographic coordinate differences and in magnitude and (grid) direction, are shown in Figures 3-2 to 3-9. Means and standard deviations of these results are given in Table 3-1.

Complete listings of observed and processed Omega data are contained in Appendix E.

TABLE 3-1

Statistics of Omega Position Offsets From Transit.

Time Span	Interval	Northing Offset		Easting Offset	
		Mean	Std Dev	Mean	Std Dev
90 0330 to 138 0000	12 hour	107 m	1610 m	-294 m	2059 m
123 1500 to 124 0400	10 min.	-1414 m	873 m	192 m	1164 m

CHAPTER 4
CONCLUSIONS

The Decca chain used during CESAR produced observations at the CESAR camp which were biased by a few tenths of a lane (as well as two apparent lane slips). Treating these biases as calibration errors improves the agreement with Transit positions from a few thousand metres to a few hundred metres. Since a 0.01 shift in both Red and Green Decca readings results in a position shift of about 250 m at the CESAR camp, this is about as good as could be expected.

The Omega positions recorded manually during CESAR agree with Transit positions to within a few thousand metres. A strong diurnal signal is apparent in the Omega data, which presumably could be at least partly modelled out. The more detailed Omega data from CESAR being analyzed by Canadian Marconi Company may be useful in this respect.

DESCRIPTION OF CESAR RADIOPOSITIONING MAGNETIC TAPE

This tape was created using the Hewlett Packard RTE-IVB utility program "SAVER". It can be read using "READR". The tape contains 25 files as described in Table A.1.

CESAR RADIOPOSITIONING EVALUATION
 Description of files

File	Name	Blocks	Lines	Contents
1	"CESAR	8	41	This description
2	&CESAR	211	1377	FORTTRAN source for evaluation program

APPENDIX D

DECCA LISTINGS

- D.1 Listing of #DE30M (30 minute data from CESAR)
- D.2 Listing of \$DE30\$ (reprocessed data, without calibration)
- D.3 Listing of \$DE30M (reprocessed data, with calibration)
- D.4 Listing of #DE01M (1 minute data from CESAR)
- D.5 Listing of \$DE01\$ (reprocessed data, without calibration)
- D.6 Listing of \$DE01M (reprocessed data, with calibration)

#DE30M T=00003 IS ON CR DW USING 00113 BLKS R=0000

APPENDIX E

OMEGA LISTINGS

- E.1 Listing of #OM12H (12 hour data, manually recorded at CESAR)
- E.2 Listing of \$OM12H (reformatted 12 hour data)
- E.3 Listing of #OM10M (10 minute data, manually recorded at CESAR)
- E.4 Listing of \$OM10M (reformatted 10 minute data)

#OM12H T=00003 IS ON CR DW USING 00200 BLKS R=0000
